MORRISON INFRARED HEATING

Morrison infrared heating systems for the benefit of the business and private markets.

All these Long Wave IR heating systems are designed to be visually attractive whilst also thermally efficient and generate a pleasantly heated environment. The Morrison series heaters are of a modern discrete design that is easy to install in existing facilities or new build constructions. As they contain no moving parts, quartz lamps or other visual indicators they are reliable, quiet and unobtrusive in operation. The long wave infrared generated by these heating panels has scientifically proven health benefits and is the most efficient form of heating available.

MORRISON PV PANELS & BATTERIES

Are you interested in getting up to 100% of your energy from Solar PV and batteries.

- Free energy direct from the Sun
- Solar PV is a Fit & Forget technology
- Simple to fit or retrofit
- Energy from low carbon source

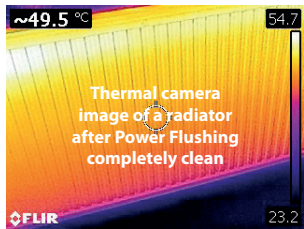

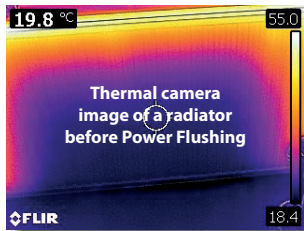

MORRISON SOLAR-ASSISTED HOT WATER SYSTEM

Morrison Solar-assisted Hot Water System combines our innovative Solar Assisted Heat Pump technology with an A rated, KIWA approved stainless steel cylinder to create our first ever thermodynamic cylinder.

Morrison's have the all in one solution for your hot water heating requirements. Enabling us to offer a complete range of Solar Assisted Heat Pumps, with either our 130L, 200L or 300L cylinder, suitable for every installation. This hot water heating and storage system has been MCS tested and utilises our already proven technologies.

Relying on the same thermodynamic principles as our existing Solar Assisted Heat Pump range, the Thermodynamic Box transfers this energy to water within its casing, to efficiently and cost effectively handle the water heating for use in your home.

MORRISON POWER FLUSHING

A Morrison Powerflush is a high velocity low pressure process that hugely increases the efficiency of your heating system.

The process can be made even more effective with the addition of powerful cleansing and mobilising agents.

The objective is to restore systems with circulation and boiler noise problems (caused by sludge and corrosion deposits) to optimum operation. Power Flushing removes these deposits and the problems that they cause.

It is prudent to power flush a heating system immediately after fitting a new boiler to an existing system to prevent possible future problems. Many systems are found to contain corrosion and sludge, even if no flow problems have yet shown themselves.

Existing debris is often mobilised by alterations to the system/piping and the increased efficiency of the new boiler, and may then accumulate in the boiler heat exchanger, causing noisy operation, reduced efficiency and, in extreme circumstances, failure of the boiler. The high efficiency and compactness of modern boilers, developed to minimise fuel costs and pollution, means that they are more susceptible to problems caused by debris in the system water.
